The 2019 AAS/AIAA Astrodynamics Specialist Conference
Portland, Maine
August 13th 2019

- Introduction
  - -Background, motivation and objectives
- Current CARA operations process
  - -Current CARA operations process
  - Automated and Manual tools
  - -CAS System
- Process Updates and Supporting Analysis
- Operations Devolution
- Conclusions

# **Background, Motivation and Objectives**

# Background: CARA History

- Initiated in January 2005 to protect the Agency's unmanned spacecraft from collision with on-orbit objects
- Currently, supports about 70 operational Agency's assets
- Located at the NASA Goddard Space Flight Center in Greenbelt, MD

# Motivation for an updated requirements architecture:

- Recent developments in SSA and Commercial Space
  - Constellations launches: 100s to 1000s per constellation
  - Space Fence Radar: Sensitivity increase of the Space Surveillance Network (SSN) from current detection of 10cm in Low-Earth Orbit (LEO) to 5cm

# Objectives

- Improvements to existing process
- An extensive evaluation initiative to re-examine
  - risk assessment algorithms and techniques,
  - develop needed improvements and
  - assemble analysis-based operational requirements
- Summarize the technical challenges encountered

Detailed process updates to some of the technical challenges will be presented in this CARA special session

- Introduction
  - Background, Motivation and objectives

# **CARA Operations Process Overview**

## **CARA Process Workflow**

DECISION POINT:
Begin Maneuver Planning

DECISION POINT: Maneuver Go / No-Go

Conjunction Identification

Analysis, Risk Characterization, HIE Identification & Notification

HIE analysis & Maneuver Planning

Maneuver Screening

Maneuver Execution

TCA- 7 Days

TCA- 5.5 Days

TCA- 3 Days

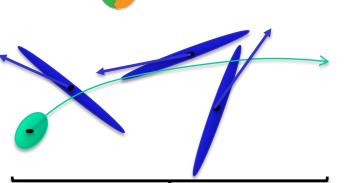

TCA- 2 Days

TCA- 1 Days

**TCA** 

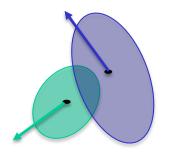

Routine

**High-Interest Event / Non-Routine** 

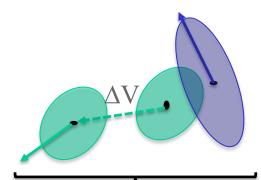

Conjunction Assessment (CA) is the process of identifying close approaches between two orbiting objects; sometimes called conjunction "screening"

The **18**<sup>th</sup> **Space Control Squadron** at Vandenberg AFB, maintains the high accuracy catalog of space objects, screens CARA-supported assets against the catalog, performs OD/tasking, and generates close approach data

**CA Risk Analysis (CARA)** is the process of assessing collision risk and assisting satellites plan maneuvers to mitigate that risk, if warranted

The **CARA** Team at NASA GSFC serves all NASA operational uncrewed satellites, and is a service provider for some other external agencies/organizations

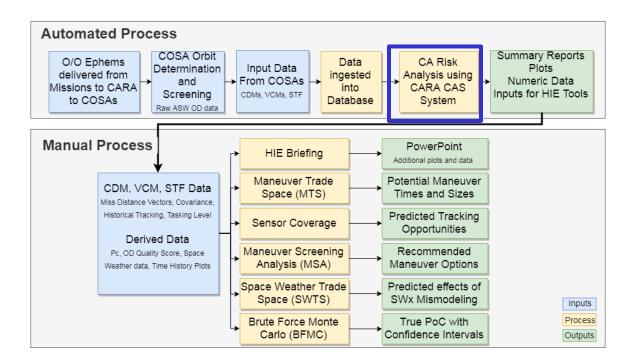

Collision Avoidance (COLA) is the process of executing mitigative action, typically in the form of an orbital maneuver, to reduce collision risk

Each satellite **Owner/Operator (O/O)** – mission management, flight dynamics, and flight operations – are responsible for making maneuver decisions and executing the maneuvers

# **Automated and Manual Process**

- The CARA workflow has both automated and manual components that:
  - ingest inputs
  - processes data: parsing and algorithmic implementation
  - provides output: numeric data, plots, and reports

# **CAS Automation Process Flow**

# Conjunction Assessment System (CAS) processes:

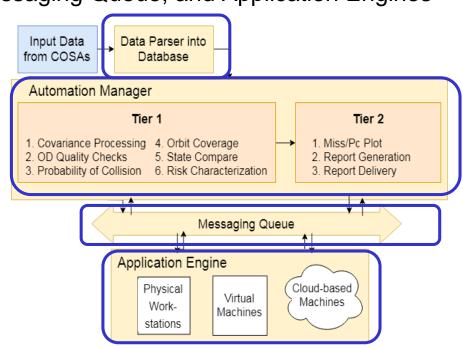

- the Conjunction Data Messages (CDMs) and
- the Sensor Tasking Files (STF) files

# CAS contains 4 main parts:

- Data parser, Automation Manager, a Messaging Queue, and Application Engines

# Services from Automation Manager:

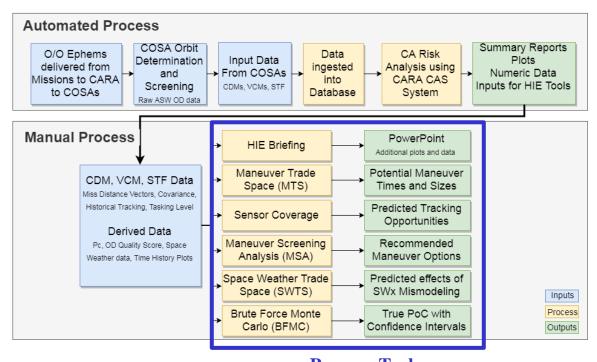

- Covariance Processing
- OD quality
- Probability of Collision (Pc)
- State Compare
- Risk Characterization
- Report Generation and
- Report Distribution

# **Automated and Manual Process**

- The improvements to the existing risk assessment algorithms and techniques are addressed
  - throughout the conjunction assessment & risk analysis of CAS and
  - the manual processing of CAS' output data for decision making

- Introduction
  - Background, Motivation and objectives

(2) Using BFMC to accurately assess Repeating Conjunctions

Maneuver Screening
Analysis (MSA)

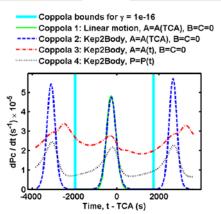

Brute Force Monte
Carlo (BFMC)

Recommended
Maneuver Options

True Pc with
Confidence Intervals

Two output plots are shown here using different numbers of trials. The left plot used 3.4E6 trials compared to 1.01E6 trials on the right. The increased number of trials reduced the 99% confidence interval. Both show the nominal 2D Pc within the confidence interval.

This strain of Monte Carlo calculation, which works with the TCA states and covariances but with the state uncertainty sampling performed in equinoctial elements, is being integrated with the NASA automated conjunction assessment system so that it can be automatically invoked in those situations in which the 2-D Pc is judged to be inadequate and for which Monte Carlo from epoch is not necessary.

- Operations Devolution
- Conclusions

# **Devolution**

- Devolution: the operations portion of CARA could be pushed out to the mission flight operation teams as an option.
  - Pending completion of 2 pilot programs over the course of the next 2 years
- CARA will still remain the CA technical authority under the NASA Office of the Chief Engineer as well as provide CA operations for non-devolving missions
- CARA will evaluate 3<sup>rd</sup> party tools to determine whether they meet the Agency's CA needs.
  - A tool certification plan identifies the essential
     ✓ and enhancing + tool features
  - Benchmark test cases are available for each item on the list (list will evolve over time as new capabilities emerge)

Item	Tool Feature	Topical Area	Maneuverable Spacecraft Requirement	Non- Maneuverable Spacecraft Requirement
Point	T-1.1	Miss-Distance Reporting	✓	✓

  - -Current CARA operations process
  - Automated and Manual process
  - -CAS System
- Process Updates and Supporting Analysis
- Operations Devolution

Conclusions

# **Conclusions**

- CA field is relatively new and so is constantly evolving
  - Data sources moving from exclusive DoD-control to commercial availability
  - Space Fence implementation adds smaller objects to catalog
  - Anticipated large constellations will add congestion in certain orbits
    - Use of electric propulsion in large constellations as missions are inserted and deorbited cause additional complication for CA due to inability to do non-cooperative tracking
- CARA performing extensive R&D to develop more robust algorithms to handle this evolution to handle the various technical challenges
- NASA plans to continue to evolve our CA process: improving operations, streamlining approaches, and collaborating with other operators to make the most of limited resources.
